TITLE: A compact electrostatic 2.5-Mev accelerator

PERIODICAL: Zhurnal tekhnicheskoy fiziki, v. 32, no. 6, 1962, 713 - 718

TEXT: In earlier work the authors together with M. T. Novikov (ZhTF, 30, 74, 1960) had designed a 1.5-Mev accelerator. In the present paper, a new linear accelerator with a greater vacuum tank (0.75 m^3) is described (Fig. 1). Hydrogen and helium ions can be given an energy of up to 2.55 Mev. If the diameter of the channel in the acceleration tube and the shape of the insulating rings (porcelain) are properly chosen a potential gradient of 2.5 - 3 Mv/m can be secured in a tube of up to 1.5 m length. Comparison with data obtained from another accelerator (I. Michael et al., Rev. Sci. Instr., 30, 855, 1959) showed that the removal of the organic glue between the electrodes and the insulating rings in the acceleration tube virtually has no effect on the electrical stability of the tube. The same holds true when the residual gas pressure is reduced to 1 - $2 \cdot 10^{-5}$ mm Hg. Up to 4 Mv an approximately linear law relates the tube length to the

Card 1/2

A compact electrostatic ...

attainable voltage. There are 2 figures.

AUTHORS: Pivovar, L. I., Novikov, M. T., Tubayev, V. M.

TITLE: Electron capture by helium ions in various gases within the energy range 300 to 1500 kev

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 42, no. 6, 1962, 1490-1494

TEXT: The cross section σ_{20} of the capture of two electrons by doubly charged helium ions in single collision with H, He, N, Ar, and Kr was measured as well as the cross section σ_{21} of the capture of one electron. A monochromatic beam of singly charged He ions was produced from an electrostatically accelerated ion beam by means of a monochromator. A beam of variously charged He ions was obtained from it by charge exchange in a special chamber. The He^{2+} ions were separated by means of a magnetic mass monochromator and led into a collision chamber. σ_{20} and σ_{21} were determined mass-spectroscopically. In nitrogen, $\sigma_{21} \sim (v_0/v)^{6.5}$, in argon

Card 1/2

Electron capture by helium ...

$\sigma_{21} \sim (v_0/v)^{6.3}$ and in krypton, $\sigma_{21} \sim (v_0/v)^{4.8}$ where v_0 is the velocity of an electron in a hydrogen atom and $v \approx 3v_0$ to $4v_0$. For low energies σ_{20} agrees well with the data of S. K. Allison (Rev. Mod. Phys., 30, 1137, 1958) and V. S. Nikolayev, et al. (ZhETF, 41, 89, 1961). For He^{2+} ion energies of $\sim$ 1300 kev, the values of σ_{20} in He, N, and krypton are about twice as large as those obtained by Nikolayev. For 1000 kev, σ_{20} is nearly three times the experimental value. As the energy increases the experimental values again approach the theoretical ones. The use of Born's approximation in the calculation of the capture cross section is suggested as the reason for this divergence. There are 3 figures.

AUTHORS: Pivovar, L. I., Tubayev, V. M., Novikov, M. T.

TITLE: Electron loss and capture by 200 - 1500 kev helium ions in gases

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 41, no. 1 (7), 1961, 26 - 31

TEXT: So far, collisions of electrons with ions, atoms, and molecules have been investigated only at energies of the latter of up to 450 kev. For the further development of the theory of atomic collisions, investigations at higher energies are of interest. The authors publish test results on cross sections for electron capture and electron loss for collisions with helium ions and also test results on equilibrium compositions in a helium beam during collisions with N_2, H_2 and also He, Kr, and Ar for the 200 - 1500 kev energy range. The experimental arrangement has been described earlier (ZhETF, 40, 34, 1961). A beam of singly-charged helium ions emerging from an electrostatic accelerator was separated by a mass monochromator and passed through the collision chamber. Both beams (He^+ and He^{2+}) were

Card 1/6

Electron loss and capture...

collected by beam catchers, and their currents were measured with vacuum-tube electrometers of type ЭМУ-3(EMU-3). The neutral He^0 beam intensity was determined with a detector by measuring the secondary electron emission from a He^0 bombarded copper foil. This detector functioned similarly to that described by P. M. Stier et al. The cross sections σ_{10} and σ_{12} of the electron capture and loss were determined by using the following expression:

$$\sigma_{10} = \left\{ d\left[\frac{N^0}{N^0 + N^+ + N^{2+}} - \left(\frac{N^0}{N^+}\right)_{backgr} \right] \Big/ d(nL) \right\}_{nL \to 0}$$

$$\sigma_{12} = \left\{ d\left[\frac{N^{2+}}{N^0 + N^+ + N^{2+}} - \left(\frac{N^{2+}}{N^+}\right)_{backgr} \right] \Big/ d(nL) \right\}_{nL \to 0}$$

N^0, N^+ and N^{2+} denote the numbers of neutral atoms of singly and doubly charged helium ions respectively; n denotes the concentration of gas atoms in the collision chamber, and L is their mean free path. For each indivdual case nL was determined as a function of the ratio of the number of secondary

Card 2/6

Electron loss and capture...

particles to the number of primary particles. The linear section of this curve was used to find the cross section. Corrections for multiple scattering were taken into account. σ_{10} and σ_{12} were determined as the mean values of two to three independent measurements. The random errors were $\leq \pm 18$ % and $\leq \pm 12$ %, respectively and the energy of the primary ions was accurate to within ± 2 %. The equilibrium composition of the beam in the collision chamber was determined by a chamber modified by the installation of an input and an output channel. Since the formation of negative helium ions at the energies employed may be neglected, it is possible to assume that in the range of 200 to 700 kev He^0, He^+ and He^{2+} will occur, and in the range of 500 to 1500 kev He^+ and He^{2+} only. In the range of 500 - 700 kev there are only about 6 % of He^0 present. If one further assumes that the capture (loss) of two electrons may also be neglected, the following relations are found: $\sigma_{21} = \sigma_{12}F_{1\infty}/F_{2\infty}$ and $\sigma_{01} = \sigma_{10}F_{1\infty}/F_{0\infty}$, where $F_{0\infty}$, $F_{1\infty}$ and $F_{2\infty}$ denote the relative concentrations of the components He^0, He^+ and He^{2+}. A table shows the results of the analysis of equilibrium compositions in the particle beam. The curves $\sigma(E)$ are shown in diagrams. Fig. 3 shows a

Electron loss and capture...

diagram which is characteristic for helium ions in nitrogen. The authors thank Professor A. K. Val'ter, Member of the AS UkrSSR, for interest. There are 5 figures, 1 table, and 9 references: 3 Soviet-bloc and 6 non-Soviet-bloc. The three most important references to English-language publications read as follows: P. M. Stier et al. Phys. Rev. 96, 973, 1954; H. Schiff. Can. J. Phys. 32, 393, 1954; C. F. Barnett, H. K. Reynolds. Phys. Rev. 109, 355, 1958.

AUTHOR: PIVOVAR,L.I., TUBAYEVA,V.M., GORDIYENKO,V.I. PA - 3553

TITLE: The Influence of Electronic Current Components on the Development of Electric Breakdown in a High Vacuum. (Vliyaniye elektronnoy tokovoy komponenty na razvitiye elektricheskogo proboya v vysokom vakuume, Russian)

PERIODICAL: Zhurnal Tekhn. Fiz. 1957, Vol 27, Nr 5, pp 997-1000 (U.S.S.R.)

ABSTRACT: The experiments were carried out in a cylindrical vacuum chamber with a diameter of 200 mm, in which a pressure of 1 - 3.10^{-6} torr was maintained. As high-frequency source a cascade generator with 180 kw was used. The breakdown voltages and the currents before breakdown between the electrodes were investigated in the case of both the existence and the lack of a magnetic field for copper electrodes at the cathode and lead electrodes at the anode as also for copper electrodes at the cathode and copper at the anode, and for copper at the cathode and aluminum at the cathode.

It was found that:

1.) The electron-current component plays an important part in the development of electric breakdown between the metal electrodes in the high vacuum.

2.) In the case of voltages which are near breakdown voltage, the electron flux forms the basic part of currents before breakdown.

Title : Plutonium Dioxide as a Nuclear Fuel.

Orig Pub : Nukleonika, 1957, 2, No 3, 465-478

Abstract : The author examines the possibility of using by way of a nuclear fuel metallic plutonium and its alloys; a limited possibility of their use is predicted. Among the plutonium compounds that have good properties as a nuclear fuel, the one chosen for study is plutonium dioxide. Comparison with uranium oxides confirms the possibility of extensive utilization of plutonium dioxide as a nuclear fuel in many types of power reactors.

TITLE: Separate Determination of Mercury Vapors and Some Organic Compounds of Mercury in the Air (Razdel'noye opredeleniye parov rtuti i nekotorykh organicheskikh soyedineniy rtuti v vozdukhe)

PERIODICAL: Nauchn. raboty khim. labor. Gor'kovsk. n.-i. in-t gigiyeny truda i profbolezney, 1957, Nr 6, pp 23-28

ABSTRACT: A method of separate determination of organic compounds of Hg [diethylmercury (D) and ethylmercurochloride] and vapors of metallic Hg has been developed; it is based on the fact that upon the addition of the reagent [into a 25 - 30 cc ground-glass-stoppered flask 5 cc of an 8% solution of $Cu(NO_3)_2$ are introduced, and 0.75 g of hydroxylamine hydrochloride, 0.5 cc of 25% solution of ammonia, and 15 cc of water are added] to the Hg compounds in an alcoholic solution (0.08% solution of iodine in 95% ethyl alcohol) there forms a precipitate consisting of a mixture of Cu_2I_2 and $Cu_2I_2 \cdot HgI_2$. D is absorbed in the range of 99.2 - 100%, ethylmercurochloride and Hg in the range of 95 - 100%. For the

SOV/137-58-8-18163

Separate Determination of Mercury Vapors (cont.)

separate determination in the air of vapors of Hg and some organic compounds of Hg the difference in the solubility of these compounds in the aqueous solutions of I and in KI under a rapid passage of air is utilized. The absorption of the vapors of D is negligibly small (~ 0.2% of the total amount). The sensitivity of the method is 0.1 Hg. The results of the determinations of Hg compounds in the air of industrial buildings are adduced.

TITLE: General analytic methods in the SSSR State Pharmacopeia

SOURCE: Meditsinskaya promyshlennost' SSSR, no. 7, 1965, 7-9

TOPIC TAGS: test method, drug, pharmacology, drug industry, quality control, analytic chemistry

ABSTRACT: The article describes methods to be introduced or more widely applied for quality control of pharmaceuticals in connection with the new edition of this pharmacopeia. It discusses control methods prescribed in recent foreign pharmacopeias and the last SSSR edition (IX), such as infrared methods, ultraviolet spectroscopy, polarography, fluorometry, pH-metry, thin-film chromatography, combustion under oxygen, and the use of standard preparations. Information on the use of these methods will be included in the new SSSR pharmacopeia. Soviet control laboratories will have be be provided with the necessary instruments, reagents, and standard preparations. Orig. art. has: None

AUTHOR: Tubl, R.

TITLE: Switching circuit for two controlled electrical circuits supplied by a single current source, for example the switching of the circuit filament-anode of powerful electron tubes

PERIODICAL: Referativnyy zhurnal, Elektronika i eye primeneniye, no. 2, 1963, 38, abstract 2V236 P (Chekhosl. pat., kl. 21c, 42/03. no. 101329, 15.10.61 (Czechoslovak patent))

TEXT: A circuit is considered which serves for the successive switching of two electrical circuits which are supplied by a common source. The circuit consists of the main switch, the cut-in relay of the first network (CR1) and the cut-in relay of the second network (CR2) with a time relay which cuts in automatically with a given delay after CR1 is engaged. In the case of short breaks in the current supply, when the delay in switching CR2 is superfluous, one uses an auxiliary relay and an auxiliary circuit. In the pro-

Card 1/2

Switching circuit ...

posed circuit diagram it is possible to considerably reduce the auxiliary circuit owing to the fact that the auxiliary relay, which cancels the action of the time relay of CR2 for short breaks in current supply, is not under the discharge current of the auxiliary circuit as usual, i.e. during the entire period in which the current is absent, but only during a shorter time interval: from the moment at which the current is again applied to the moment at which the auxiliary relay cuts in; following this, the latter is maintained in operating condition (the time relay does not operate) by the current from the common source. This is achieved by connecting the coil of the auxiliary relay to the discharge network of the auxiliary circuit only at the moment when the main on-off switch is cut in and CR2 with the time relay is cut out. An actual circuit is proposed.
